Swedavia Airports

Environmental and energy policy

Purpose and objectives

Swedavia owns, operates and develops airports and properties near these airports in Sweden. We strive to continuously develop our management system (ISO 14001) to identify and prevent risks related to environment and energy, take advantage of opportunities and use resources in a sustainable manner throughout the value chain. This is done primarily by reducing greenhouse gas emissions, where we shall maintain at least 90 percents emissions reductions in Scope 1 and 2 and reach net zero in Scope 3 by 2050 at the latest, aligned to applicable net zero frameworks.

We shall also minimize other atmospheric emissions and discharges to soil and water and minimize the use of harmful chemicals. Through systematic work with climate analyses, we adapt to the changing climate. Swedavia shall promote biological diversity, secure effective management of resources in order to contribute to circular economy and continuously work to improve energy efficiency.

For us, it is a given that we comply with environmental and energy statutes in effect as well as other applicable national and international regulations and requirements. It is also a given that we ensure access to the information and resources required to achieve our environmental and energy objectives and targets. We shall also work to limit aircraft noise and emissions from aircraft operations.

Fundamental rules

In order to achieve this, working in accordance with the following fundamental rules is required:

- Environmental concern is integral to every part of operations and is taken into consideration in every decision.
- The most important environmental issue for the aviation and real estate sectors is their climate impact, and this must be given priority in decisions and activities.
- We shall continuously improve energy efficiency and manage our own operations as well as influence other companies and organizations that we interact with for the sustainable use of resources.
- We shall purchase energy-efficient products and services and promote construction that leads to better energy performance.
- All of Swedavia´s employees shall take part in our environmental and energy work.
- We shall assess and manage risks related to environment and energy in a systematic manner.
- Swedavia shall take an active part in local, regional, national and international work in order to reduce the aviation industry´s negative impact on the environment and work for the sustainable development of airports and their energy supply.

Implementation and follow-up

Self-monitoring, audits and compliance monitoring are examples of follow-up that provide us and our stakeholders with quality-assured information about Swedavia’s impact on the environment.

Mats Johannesson
President and Group CEO
